

# Installing LaBB-CAT on Windows

LaBB-CAT is a web-browser based application, and is primarily designed to run on a central web server accessible over the internet, so that multiple collaborators can easily work on the same corpus data from different locations.

However, it is possible to have a ‘private’ installation of LaBB-CAT which runs directly on your personal computer. These instructions explain how to achieve that.

On Windows, before you can install LaBB-CAT, you first must have Java installed.

## 1. Check Java

Use the following steps to check whether you already have Java installed.

1. Press the  Start menu button.
2. Type Control Panel
3. Select the *Control Panel* option that appears.

4. Type Java

If a *Java* icon appears as shown in Figure 1, then you already have Java, and can skip section 2.

Figure 1: Java in the Control Panel

If there's no *Java* icon in the Control Panel, follow the steps in the next section to install it.

## 2. Install Java

1. Open the Java website in your browser:  
<https://www.java.com/>
2. Press the *Download Java* button.
3. Press the *Download Java* button on the next page and save the resulting installer file.
4. Click the installer to run it.

Figure 2: The Java installer

5. Press *Install*.

Figure 3: Java installation is complete

6. Press *Close*.

### 3. Install LaBB-CAT

Once Java is installed, you can install LaBB-CAT:

- (1) Open the following page in your web browser:  
<https://sourceforge.net/projects/labbcats/files/install/>  
This page has all versions of the LaBB-CAT installer, both for personal computer installations and also for web-server installations. The files are listed most recent first.
- (2) Download the first file named *install-labbcats\_yyyymmdd.jar* (where *yyymmdd* are numbers).
- (3) Double-click on the file you just downloaded to open it.

You should see the LaBB-CAT installer program (Figure 4).

Figure 4: LaBB-CAT Installer

- (4) Press *Start*.

You should see a progress bar while components are installed and files are copied.

Once the installation is finished, the progress bar will be all blue, and there will be a button labelled *Finished* (Figure 5).

Figure 5: Installer finished

- (5) Press *Finished*.

The LaBB-CAT Server application will appear, as shown in Figure 6.

Then your default web browser will open on your LaBB-CAT home page, as shown in Figure 7.

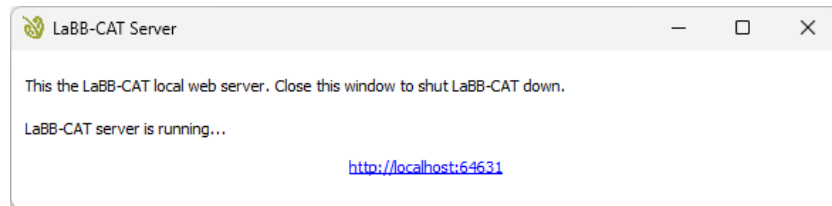

Figure 6: LaBB-CAT Server

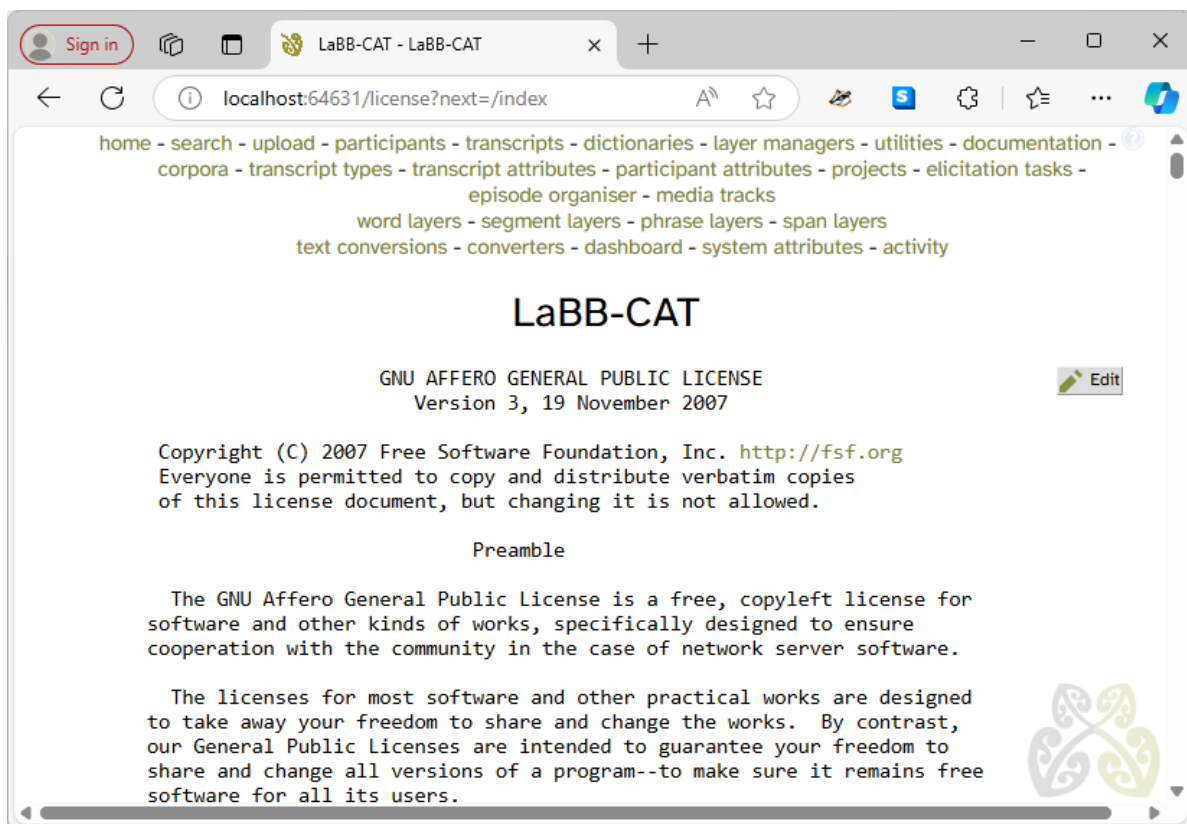

Figure 7: LaBB-CAT is successfully installed and running

(6) If you are shown the LaBB-CAT Licence page, scroll to the bottom and press *I Agree*.

As seen in Figure 8, in your Start Menu, you will see that there is a LaBB-CAT app that can be used to start and access LaBB-CAT from now on.

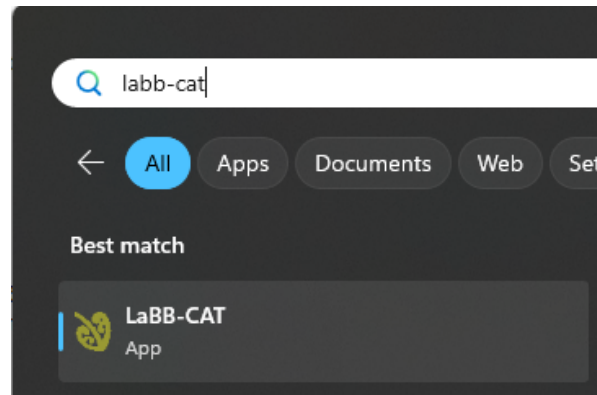

Figure 8: Use Start/LaBB-CAT to open LaBB-CAT

This starts the LaBB-CAT Server app (Figure 6), which must be running when you're using LaBB-CAT. It can be closed once you've finished working with LaBB-CAT.

## Uninstalling LaBB-CAT

In future you may want to uninstall LaBB-CAT, in which case you can use the same installer you used to install it.

If you run *install-labbcats\_yyyymmdd.jar* and LaBB-CAT is already installed, after pressing *Start* it will offer further options.

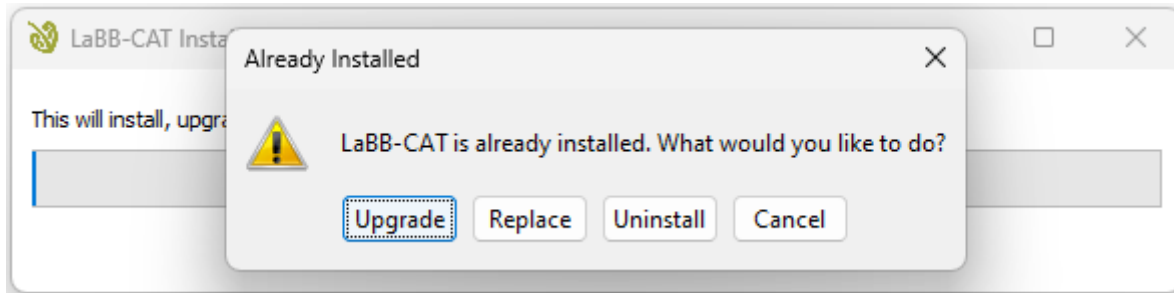

Figure 9: Running *install-labbcats\_yyyymmdd.jar* when LaBB-CAT is already installed

The options are:

- **Upgrade** – Install this version of LaBB-CAT, keeping all your corpus data intact.
- **Replace** – Install LaBB-CAT afresh, deleting all your existing corpus data and leaving you with an empty LaBB-CAT installation.
- **Uninstall** – Remove LaBB-CAT from your personal computer.
- **Cancel** – Close the installer without taking any action.
